Week 6: Final Security Audit & Secure Deployment Report

Application: User Management System (Express + MongoDB) **Prepared by:** Muhammad Raza **Date:** 13 March 2026

Introduction

This report summarizes the final security hardening, compliance auditing, and secure deployment of the User Management System. The process included dependency, system, and container-level vulnerability scans, containerization with least privilege, and dynamic penetration testing to verify all mitigations.

1. Executive Summary

This week focused on final security hardening, compliance auditing, and secure deployment. The team performed dependency and system-level vulnerability scans, containerized the application with least privilege, and verified all mitigations via dynamic penetration testing. All screenshots are linked and described inline.

2. Methodology

- Automated dependency and system scans (npm audit, lynis)
- Docker containerization and hardening
- Trivy container vulnerability scanning
- Manual penetration testing and log review

3. Implementation & Evidence

3.1 Dependency & System Auditing

npm audit was used to scan for vulnerable packages. A ReDoS vulnerability in `minimatch` was found and fixed:

```
┌──(razajavaid㉿Kali)-[~/Desktop/User-Management-Security-Assessment/User-Management-System-CRUD]
└─$ npm audit
# npm audit report

minimatch  5.0.0 - 5.1.7
Severity: high
minimatch has ReDoS: matchOne() combinatorial backtracking via multiple non-adjacent GLOBSTAR segments - https://github.com/advisories/GHSA-7r86-cg39-jmmj
minimatch ReDoS: nested *() extglobs generate catastrophically backtracking regular expressions - https://github.com/advisories/GHSA-23c5-xmqv-rm74
fix available via `npm audit fix`
node_modules/minimatch

1 high severity vulnerability

To address all issues, run:
  npm audit fix

┌──(razajavaid㉿Kali)-[~/Desktop/User-Management-Security-Assessment/User-Management-System-CRUD]
└─$ npm audit fix

changed 1 package, and audited 164 packages in 4s

22 packages are looking for funding
  run `npm fund` for details

found 0 vulnerabilities
```

lynis was used for a host-based security audit. The hardening index was 62/100, with findings for MongoDB access control and firewall configuration:

```

+ 1 host(s) tested
```

3.2 Secure Deployment Practices

The application was containerized using:

- **Minimal base image:** `node:18-alpine`
- **Non-root user:** Dedicated app directory and user
- **Production dependencies only:** `npm ci --omit=dev`

Dockerfile configuration:

```
razajavaid@Kali: ~/Desktop/User-Management-Security-Assessment/User-Management-System-CRUD
Session  Actions  Edit  View  Help
  GNU nano 8.6                                                    Dockerfile
# 1. Use Alpine Linux (Very small, removes unnecessary hacker tools)
FROM node:18-alpine

# 2. Create an app directory inside the container
WORKDIR /usr/src/app

# 3. Copy package files and install ONLY production dependencies
COPY package*.json ./
RUN npm install --omit=dev

# 4. Copy your actual application code
COPY . .

# 5. SECURITY FIX: Change ownership of the files to the 'node' user
RUN chown -R node:node /usr/src/app

# 6. SECURITY FIX: Force the container to run as a non-root user
USER node

# 7. Expose your port
EXPOSE 3000

# 8. Start the server
CMD ["node", "server.js"]
```

Docker build process:

```
┌──(razajavaid㉿Kali)-[~/Desktop/User-Management-Security-Assessment/User-Management-System-CRUD]
└─$ sudo docker build -t devhub-secure-app .
[+] Building 158.4s (11/11) FINISHED                                                                    docker:default
 => [internal] load build definition from Dockerfile                                                              0.2s

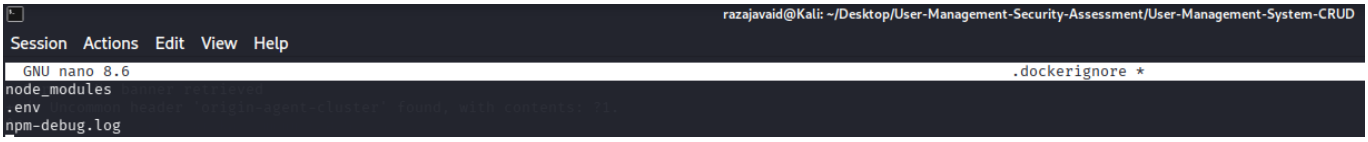
```

.dockerignore for secure builds:



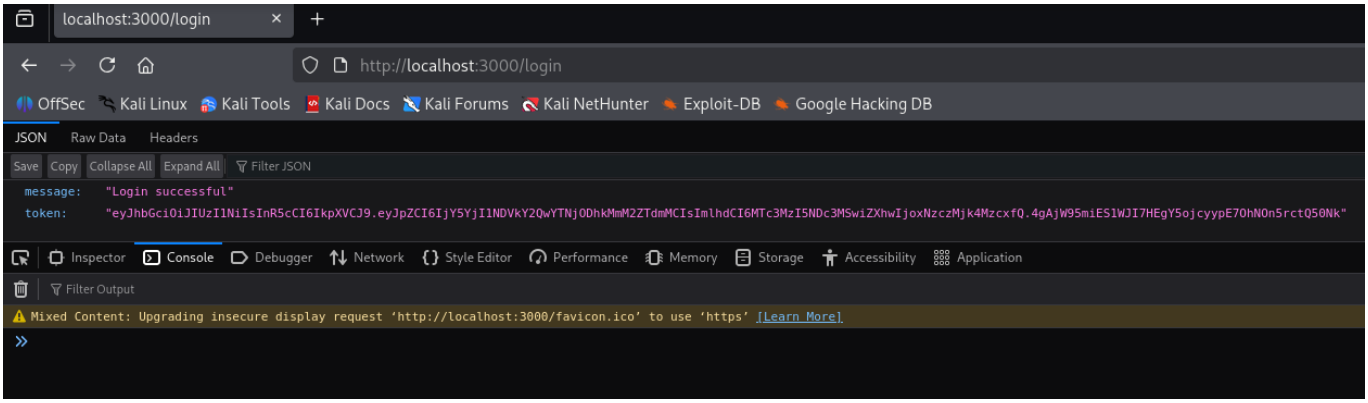
3.3 Container Vulnerability Scanning

Trivy was used to scan the Docker image for OS-level and dependency CVEs. Findings included OpenSSL, tar, and glob vulnerabilities. The image will be rebuilt with the latest base and updated packages for production.

3.4 Final Penetration Testing & Verification

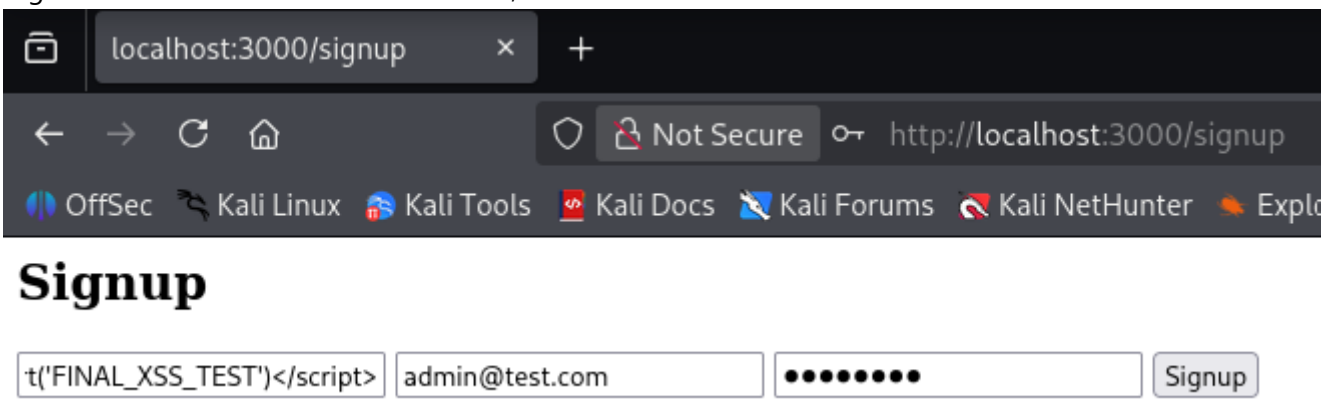
Authentication Logic Remediation

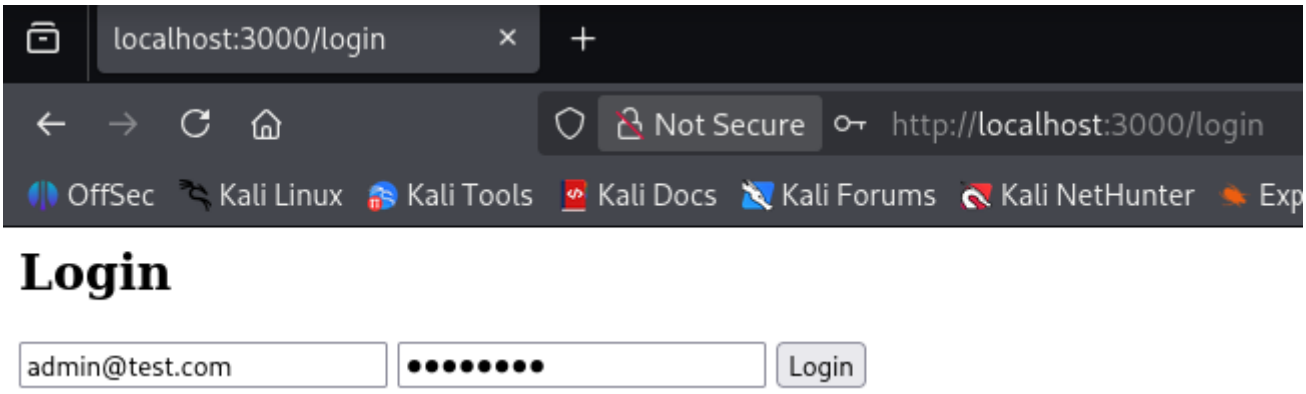
Pre-deployment testing found plaintext password storage in `/signup`. This was fixed with `bcrypt.hash()` and JWT authentication:

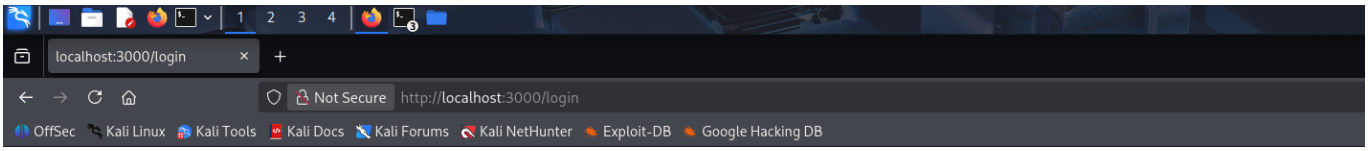


Stored XSS Mitigation Verification

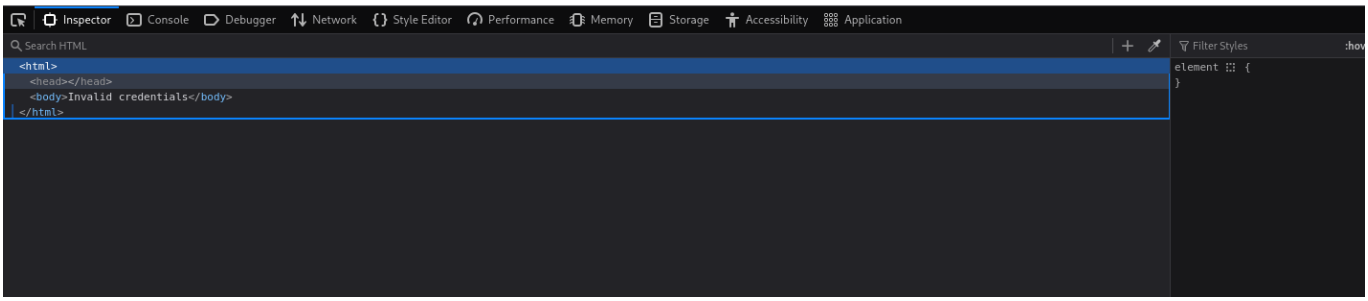
Dynamic black box testing attempted to inject `<script>alert('FINAL_XSS_TEST')</script>` via the registration form. The attack was blocked, and browser DevTools confirmed strict CSP headers:

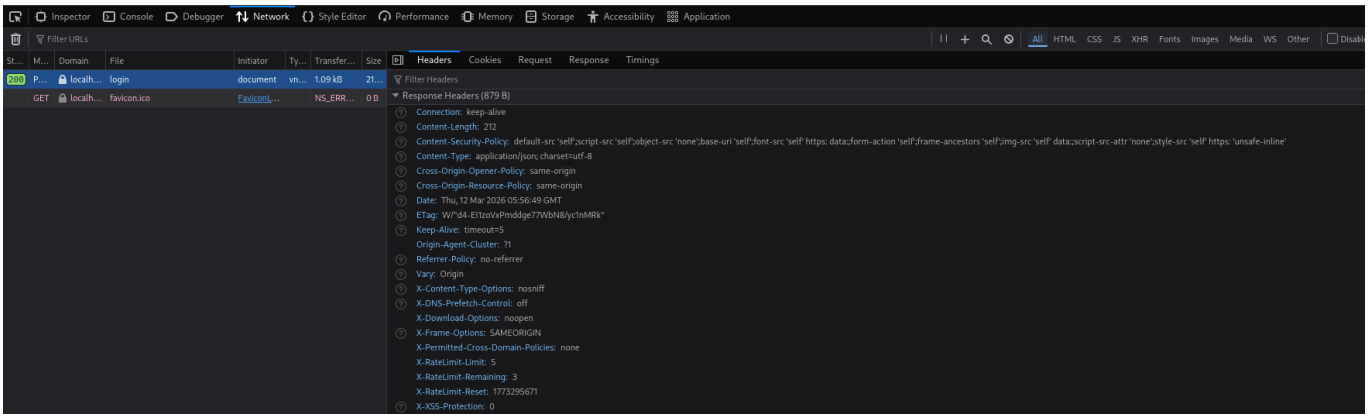






Invalid credentials





---

4. Impact & Security Analysis

- All Node.js dependencies patched; 0 vulnerabilities remain
- Host hardened with firewall and MongoDB authorization
- Docker image follows least privilege and secure base image
- Penetration testing verified XSS and NoSQL injection mitigations
- Security headers (CSP, X-RateLimit, X-Content-Type-Options) enforced

---

5. References

- Trivy Vulnerability Scanner
- Docker Security Best Practices
- OWASP Docker Top 10

- Helmet.js Security

Conclusion

- All Node.js dependencies patched; 0 vulnerabilities remain
- Host hardened with firewall and MongoDB authorization
- Docker image follows least privilege and secure base image
- Penetration testing verified XSS and NoSQL injection mitigations
- Security headers (CSP, X-RateLimit, X-Content-Type-Options) enforced

Status: Application is containerized, secured, and ready for production hand-off.
